Temperature Rise (ref.)

Made to Order

A wide application range is one of the features of cement resistors. MICRON's resistors are arranged in many ways to obtain a variety of advantages to meet the requirements of users. Some typical examples are given below. In addition to such apparent

arrangements, we can accept orders for items of non-inductive (AP-windings), solvent-proof, ultra-low-resistance (as low as 0.001 available) types and resistance deviating from the specified range together with combinations of these specifications.

● Derating Curve (ref.)

The temperature limited resistors and fusing resistors have sufficient characteristics to function as fail-safe resistors. In particular, there are temperature limited resistors and fusing resistors authorized by the UL, bearing the mark **UL**. Their fundamental constructions and shapes are equivalent to those of standard products, except for the special arrangements to meet the requirements of UL1412. Since naming and resistance range are different from those of standard products, these should be carefully specified when ordering.

★★★★The fusing resistors with the type No. FA1 for 2 watts (110~220ohms), 3 watts (135~270 ohms), and 10 watts (600~1,200ohms) should be separated by 3/16 inches (4.8mm) from the mounting surface. There should also be a distance of 5/32 inches (4mm) between the resistor and the non-insulated part of the opposite-polarity body or the non-insulated dead metallic section.

★★★★The fusing resistors with the type No. FN (1/4 watts for all resistances and tolerance ranges) should be checked by adequate limited short-circuit testing in the completed equipment.

MEG Thermal Fuse Incorporated Cement Resistors

MES

MER

Since thermal fuses are incorporated, cement resistors respond quickly to overloading as well as external overheating. These resistors also provide outstanding features against surges. Therefore they are suitable for the prevention of inrush current for switching regulators.

MOS Large-Capacity Cement Resistors in Ceramic Case

This is a series of large-capacity cement resistors contained in non-metallic cases. Since these resistors can be arranged into modules, conventional resistors of the same classes (large-capacity paint resistors, enameled resistors) can be immediately replaced with them. They are economically advantageous.

Note: Items for non-inductive spec. (AP wound), Ultra-low-resistances (20m available), and series 250 Faston terminals can also be manufactured.

Temperature rise (ref.)

This model is a composite element with a linear response characteristic to temperature. It can operate in resistance mode and voltage mode. The linear temperature range comes in three categories: $-30^{\circ}\text{C}\sim 50^{\circ}\text{C}$, $-20^{\circ}\text{C}\sim 80^{\circ}\text{C}$, and $0^{\circ}\text{C}\sim 100^{\circ}\text{C}$. A linearity within $\pm 0.5^{\circ}\text{C}$ is assured in each linear temperature range.

When used in the resistance mode, the resistance value is linearly reduced with temperature rise.

When used in the voltage mode, the voltage output increases with temperature rise (positive slope) or decreases with it (negative slope).

Features

- This is a composite element consisting of a thick film thermistor and a thick film resistor, protected by a glass film and contained in a metallic case.
- The terminal construction comes in two types; a cord type and a frame terminal type. The desired type should be selected according to the purpose and the mounting method.
- For use in the resistance mode, b (resistance at $T=0^{\circ}\text{C}$) and M (gradient of R/T) can be modified by changing the various constants of the thick film thermistor and thick film resistor, without impairing the linearity.
- For use in the voltage mode, the values b and M can also be modified.
- Compared with platinum thermosensor, thermocouple, etc., a high sensitivity is offered.
- Since a linear output feature is provided and a large volume of output variation is expected, this model can be directly connected to a digital meter and a device that operates with a linear input.
